

Initial Email from client

Yes, I was supposed to write up something for Omar to give to you, my apologies. I'll send him the info too but basically it's a database/front end and possibly mobile app for a not for profit I founded.

It's an animal rescue group, we get information from pounds in Ontario and Quebec for animals (dogs right now only) that need to get out either for medical reasons or otherwise are not able to be adopted. There is basic info on the animals, there are and rescues that the animals get sent to. Right now I get the information for each dog from the pound in the form of an image/images, we are transcribing it and post to Facebook and email to my rescue list. It's turning out to be quite time consuming in some cases and for sure not scalable so any step towards a bit more of an automated process would be really helpful (and save lives on top of that).

Organization name?

Any other organization info you can provide.

Is French required as it will be used in Quebec as well?

How does the current system work?

What types of animal information? (could we get some examples of these images?)

Any legal rules about the protection of medical information?

Do specific "rescues" handle different animal needs?

"Rescues" have different location limits?

Where will the project be hosted? Some machine details such as operating system.

Project goals accuracy, scalability and ease of use.

Additional Constraints?

Additional Stakeholders?

- Founders and client
- Rescuers (User)
- Pounds (User)
- Charities/Fundraisers
- Sponsors/ Donors
- Dogs

- Volunteers
- Board of Directors
- Assistant Professor Omar Alam

Browser compatibility on the web side?

App platform support?

Automatic contacting rescuers?
